**Ugo Amaldi**

*University Milano Bicocca and TERA Foundation*

# *Nuclear medicine*

**Radioactivity in diagnostics:  
SPECT = Single Photon Emission Computer Tomography**

**Emilio Segrè**

**1936: Discovery of technetium  
with Perrier**

**1938: discovery of  $^{99m}\text{Tc}$   
with Ed McMillan**

# In the 50s at BNL the « cow » was made productive

In reactors slow neutrons  
produce  $^{99}\text{Mo}$  through fission

$$^{99}\text{Mo} (66 \text{ h}) = ^{99m}\text{Tc} (6 \text{ h}) + e^- + \nu$$

Walter Tucker and Powell Richards

85% of all nuclear medicine

examinations use  
molibdenum/technetium

generators for diagnostics of

... liver

lungs

bones .....

Lead collimators to channel  
the gammas of 0.14 MeV

# Production of $^{99}\text{Mo}$ : present

- A. Fission chain in nuclear reactors
- B. Reprocessing of the special fuel bars

Worldwide production of 100 000 curies per year at **aging** nuclear reactors for **30 million examinations/year**:

BR2 Belgium	
NRU Canada	(50%)
OSIRIS France	
HFR Netherlands	(40%)
SAFARI-1 South Africa	

# Production of $^{99}\text{Mo}$ : possible solutions of a serious problem

## Photofission of Uranium

Triumph and NDS Nordion (Canada): could cover 10% of the market

## Neutron capture on $^{98}\text{Mo}$

Advanced Accelerator Applications (CERN spin-off): could cover 100% of the market

# *High-current cyclotrons used in medicine*

## **Baby Cyclotrons (below 18 MeV)**

*In-house facility*

Mainly used for production of short-lived positron emitters like  $^{18}\text{F}$ ,  $^{11}\text{C}$ ,  $^{13}\text{N}$ ,  $^{15}\text{O}$ .

## **Medium Energy Cyclotrons (below 40 MeV)**

*Centralised facility*

Majority of the cyclotron produced isotopes are produced using such machine viz,  $^{123}\text{I}$ ,  $^{201}\text{Tl}$ ,  $^{67}\text{Ga}$ ,  $^{68}\text{Ga}$ ,  $^{103}\text{Pd}$  etc.

## **High Energy Cyclotrons (above 40 MeV)**

*Centralised facilities and research institutions*

Used for production of few radioisotope requiring high energy for production viz,  $^{67}\text{Cu}$ ,  $^{82}\text{Sr}$ ,  $^{211}\text{At}$ .....

## IBA's ARRONAX in Nantes

4 Particles:  $H^-$  /  $D^-$  /  $He^{2+}$  /  $HH^+$

Variable energy: 15 MeV  $\rightarrow$  70 MeV

### Performances:

- 750  $\mu$ A  $H^-$
- 35  $\mu$ A  $He^{2+}$

# Examples of endotherapy with radioisotopes

$^{213}\text{Bi}$   
 $^{211}\text{At}$

← 70  $\mu\text{m}$  →

**Alfa-decay:**

**Helium nucleus**

**It can be called:**

**“Systemic hadrontherapy”**

**Ourtesy of ARRONAX – Nantes - France**

# *Cancer therapy with X ray and hadron beams*

# 'Conventional' radiotherapy: linear accelerators dominate

electrons

Linac for electrons  
3 GHz  
5-20 MeV

X

Multileaf  
collimator

1 linac  
every  
<250,000  
inhabitants

In the world radiation oncologists  
use 15 000 electron linacs  
40% of all the existing accelerators

# The icon of radiation therapy with charged hadrons

**Radiation beam in matter**

# Protons and ions spare healthy tissues

200 MeV - 1 nA  
protons

4800 MeV – 0.1 nA  
carbon ions  
which can control  
radioresistant  
tumours

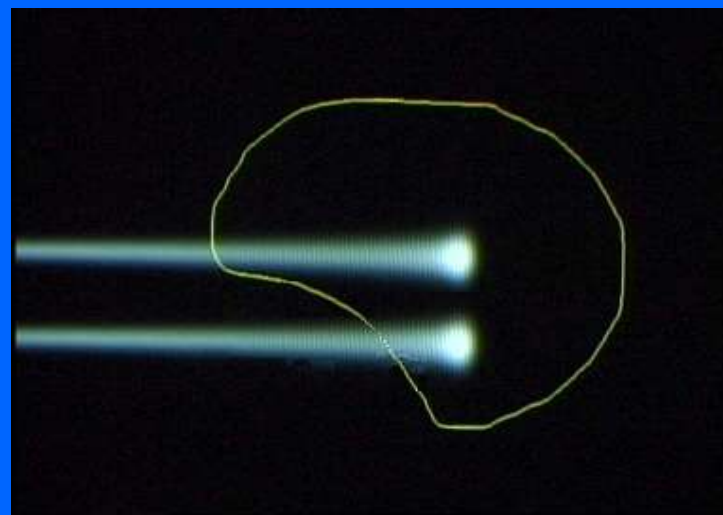

# *Charged hadrons can deliver the dose in three dimensions*

Longitudinal movement by varying the energy of the beam

# *Charged hadrons can deliver the dose in three dimensions*

Lateral movement with a transverse magnetic field

# Protons are quantitatively different from X-rays

# Carbon ions are qualitatively different from X-rays

Carbon ions deposit in a cell 24 times more energy than a proton producing not reparable multiple close-by double strand breaks

Carbon ions can control radio-resistant tumours

## ***Accelerators for hadrontherapy (\*)***

**(\*) Also hadron therapy, particle therapy**

**The accelerator is only a 'small' part of a therapy centre**

# The accelerators used today in hadrotherapy are “circular”

## Teletherapy with protons (200-250 MeV)

**CYCLOTRONS (\*) (Normal or SC)**

**SYNCHROTRONS**

(\*) also synchrocyclotrons

## Teletherapy with carbon ions (4800 MeV = 400 MeV/u)

**SYNCHROTRONS**

# Loma Linda Medical University Centre: first patient 1992

- First hospital-based proton-therapy centre  
1500 patients/year

Built at  
Fermilab

**Protontherapy: cyclotrons and synchrotrons...**

Beam Injection 7MeV

# Cyclotron for protons by Ion Beams Applications - Belgium

**Five companies offer turn-key centres for 120 Meuro.  
If proton accelerators were 'small' and 'cheap',  
no radiotherapist would use X rays.**

# Protontherapy is booming

## *Therapy with carbon ions*

# HIMAC in Chiba is the pioner of carbon therapy (Prof H. Tsujii)

Yasuo Hirao

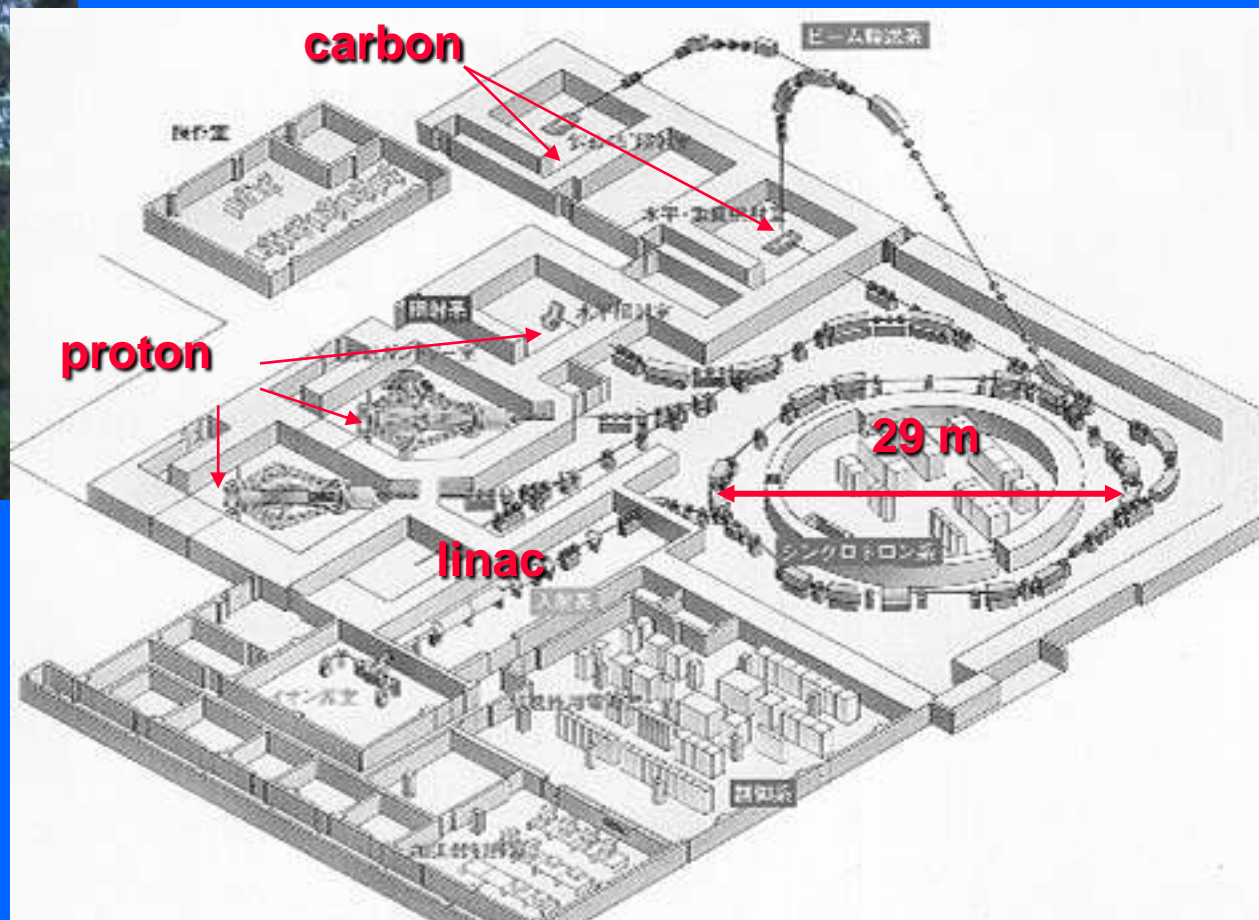

<sup>15</sup> Hirao, Y. et al, "Heavy Ion Synchrotron for Medical Use: HIMAC Project at NIRS Japan" Nucl. Phys. A538, 541c (1992)

# First important results obtained with protontherapy

Indication	End point	Results photons	Results carbon HIMAC-NIRS	Results carbon GSI
Chordoma	local control rate	30 – 50 %	65 %	70 %
Chondrosarcoma	local control rate	33 %	88 %	89 %
Nasopharynx carcinoma	5 year survival	40 -50 %	63 %	
Glioblastoma	av. survival time	12 months	16 months	Table by G. Kraft 2007 Results of C ions
Choroid melanoma	local control rate	95 %	96 % (*)	
Paranasal sinuses tumours	local control rate	21 %	63 %	
Pancreatic carcinoma	av. survival time	6.5 months	7.8 months	
Liver tumours	5 year survival	23 %	100 %	
Salivary gland tumours	local control rate	24-28 %	61 %	77 %
Soft-tissue carcinoma	5 year survival	31 – 75 %	52 -83 %	

## **Numbers of potential patients (\*)**

### X-ray therapy

every 10 million inhabitants: 20'000 pts/year

### Protontherapy

12% of X-ray patients 2'400 pts/year

### Therapy with Carbon ions for radio-resistant tumour

3% of X-ray patients 600 pts/year

TOTAL every 10 M about 3'000 pts/year

**(\*) Combining studies made in Austria, Germany, France, Italy and Sweden - ENLIGHT**

## *New centres for carbon ion therapy*

Completion: end 2010

# The site of HIT the Heidelberg Ion Therapy

Medical Director: J. Debus

Technical Director: T. Haberer

# HIT at Heidelberg

First beam extracted in 2007

First patient: End of 2009

TERA has proposed and designed the 'dual' National Centre for carbon ions and protons

**1. CNAO is being built in Pavia**

TERA has introduced and developed a novel type of accelerator:  
the "cyclinac"

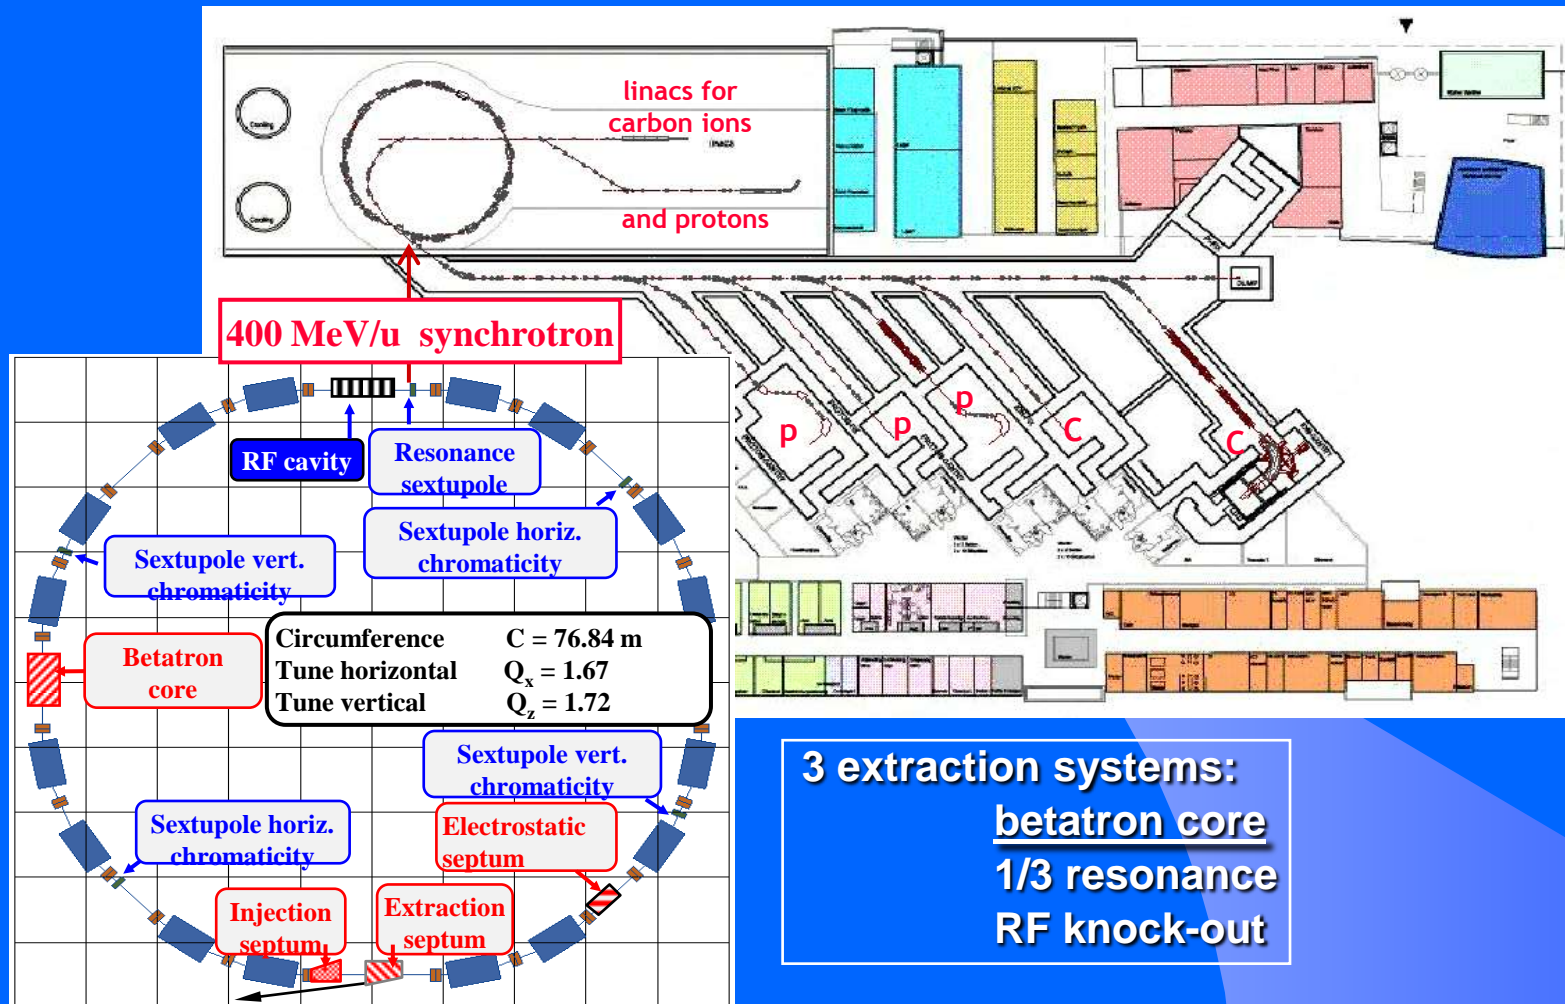

**2. "cyclinacs for protons and carbon ions"**

# PIMMS at CERN from 1996 to 2000

CERN–TERA–MedAustron Collaboration for optimized medical synchrotron

Project leader: P. Bryant

Chairman of the PAC: G. Brianti

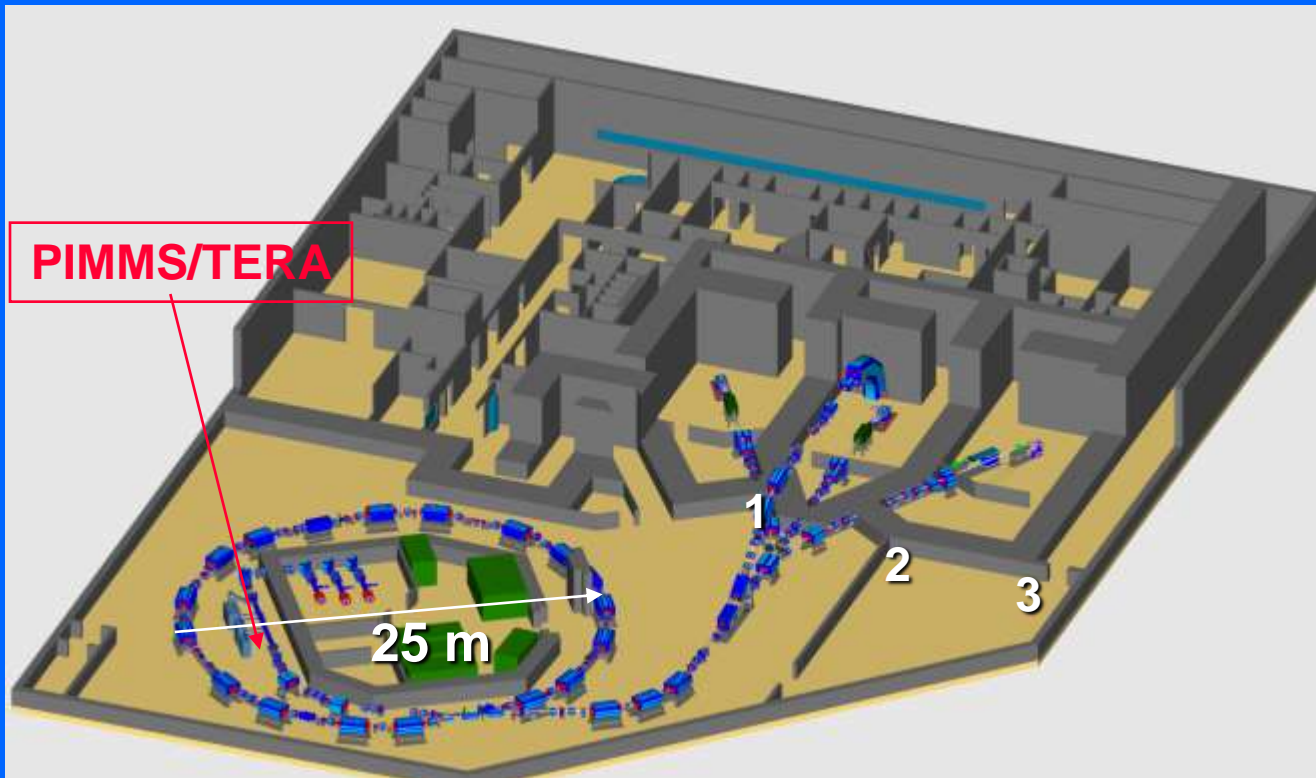

# **CNAO = Centro Nazionale di Adroterapia**

CNAO Foundation created by the Italian Government in 2002:

4 Hospitals in Milan, 1 Hospital in Pavia and TERA

In October 2003 TERA passed to CNAO  
the design of CNAO (3000 pages) and 25 people

**Since 2004 INFN is  
"Istituzional Participant"  
with people and  
important construction  
responsabilities  
(Caudio Sanelli)**

**INFN runs CATANA for  
eye protontherapy in  
Catania**

# **CNAO = Centro Nazionale di Adroterapia at Pavia**

**President: Erminio Borloni**

**Medical Director: Roberto Orecchia**

**Technical Director: Sandro Rossi**

**Hospital building**

**High-tech building**

# CNAO = Centro Nazionale di Adroterapia at Pavia

May 2009

PPS

*Treatment room: September 2009  
First patient in fall 2010*

# Siemens Medical is building for 2012 a 'dual' centre in Kiel (\*)

North European  
Radiooncological  
Center Kiel

# In 2007 MedAustron has been approved for Wiener Neustadt

- 2 (3) Sources, (p, C, redundancy)
- RFQ
- IH (7 MeV/n)
- Synchrotron 400 MeV/n, 800 MeV
- 3 (4) Treatment rooms
- 2 Experimental beam lines

**MedAustron will build a centre based on the CNAO construction drawings (by agreement with CERN-CNAO-INFN )**

# Projet ETOILE

End of 2009:  
Choice of the  
constructor

# ***ENLIGHT and the European projects***

## ***European Network for LIGHT-ion Hadron Therapy – 2002 - 2005***

- GSI project for the University of Heidelberg Clinics (**ready to treat**)
- TERA project for CNAO in Pavia (**completing construction**)
- Marburg and Kiel centres (**in construction by Siemens Medical**)
- Med-Austron for Wiener Neustadt (**approved**)
- ETOILE in Lyon (**approved**)  
Competitive tendering

**SINCE 2002 THESE GROUPS + CERN + GSI AND MANY OTHERS ARE PART OF THE**

**ENLIGHT PLATFORM** co-ordinated by Dr. Manjit Dosanjh  
Programs approved in FP7 : PARTNER , ULICE , ENVISION  
for a total of 20 MEuro

# *The next fast cycling accelerators for carbon ion therapy*

# TERA Cyclinac = Cyclotron+Linac for Image Guided Hadron Therapy

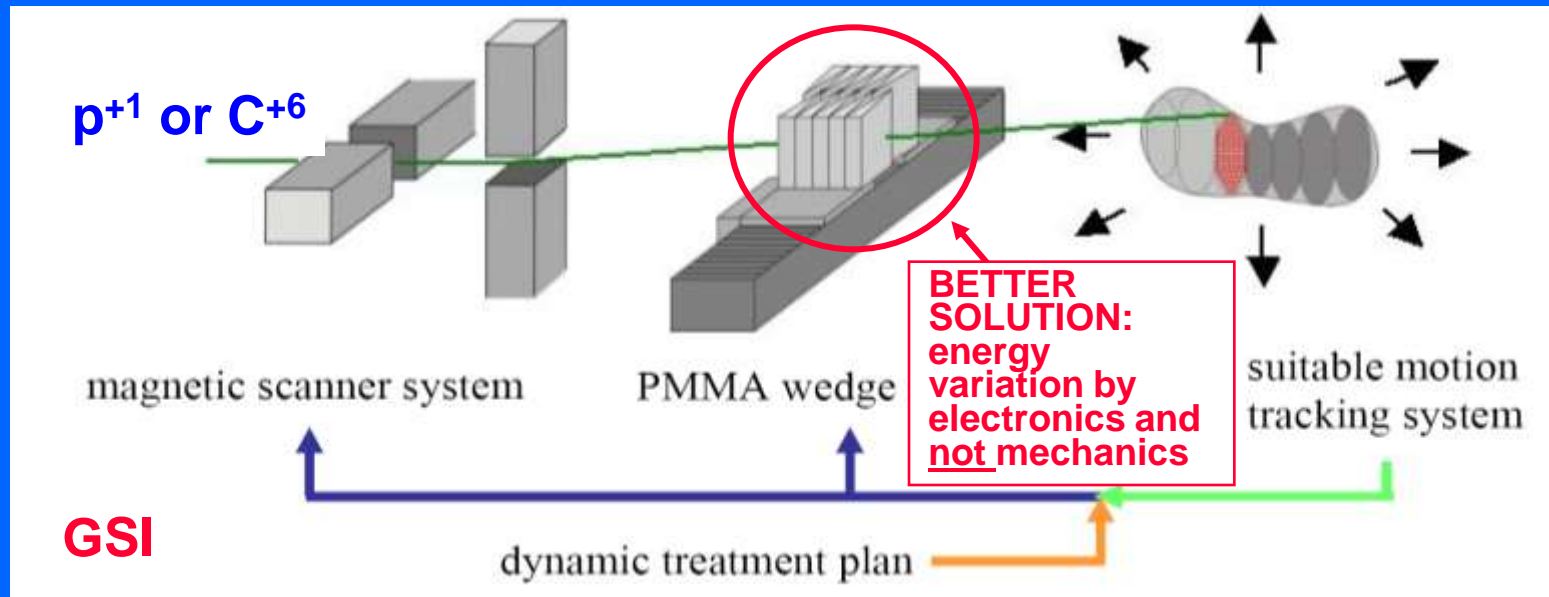

The energy is adjusted in 2 ms in the full range by changing the power pulses sent to the 16-22 accelerating modules

The charge in the next spot is adjusted every 2 ms with the computer controlled source

# GSI approach to treat moving organs: depth with fast absorbers

Sven O. Grözinger, GSI Darmstadt

static

moving,  
non-compensated

moving,  
compensated

# *IDRA = Institute for Diagnostics and Radiotherapy : a proton cyclinac*

A.D.A.M. SA, Application of Detectors and Accelerators to Medicine, a CERN spin-off company will build LIGHT, and has an agreement with IBA for the delivery of the rest and the overall control

# The two phases of the dual centre for Catania

Superconducting cyclotron by LNS/IBA (250 MeV protons and 3600 MeV carbon ions) is commercialized by IBA

# Properties of fast-cycling accelerators

Accelerator	Beam always present during treatments	Energy variation by electronic means	Time needed for varying the energy
Cyclotron	<u>Yes</u>	No	80é100 ms (*)
Synchrotron	No	<u>Yes</u>	1 second
<b>FCA</b>	<u>Yes</u>	<u>Yes</u>	<b>1 millisecond</b>

The energy is changed by adjusting the RF pulses to the modules

(\*) With movable absorbers

The beam is ideal to paint many times moving tumours in 3D without variable absorbers

Many 15-70 MeV high-current cyclotrons are commercially available for isotope production. Systemic hadrontherapy could cure metastases. High current accelerators may help solving the technetium crisis.

For protontherapy, which is booming, five companies offer cyclotron/synchrotron based turn-key centres

For carbon ion therapy, Europe is well advanced (5 centres in construction) and four companies offer synchrotron based centres, but the difficulty still is in the dimensions of the ion gantry (1<sup>st</sup> challenge: new superconducting gantries).

For the 2<sup>nd</sup> challenge, i.e the following of moving tumour targets, a fast cycling accelerator with variable energy would allow electronically driven multipainting : cyclinacs are the closest solution.

**THE END**

**CNAO in Pavia**
